PrajaPulse NGO Login — Complete Feature and Implementation List

The NGO login should be an operational workspace, not just a dashboard where NGOs see statistics. An NGO should be able to discover civic problems, organize campaigns, manage volunteers, coordinate with citizens and government, submit evidence, collaborate with other NGOs, and track its verified contributions.

Your existing PrajaPulse flow already establishes a connection between citizen reports, community validation, government escalation, NGO support, cleanup activities, verification, rewards, and impact tracking. The NGO login should connect to those existing modules rather than build separate versions of them.

1. Complete NGO dashboard structure

This is the recommended navigation for the NGO account.

1. NGO Overview
Organization status, urgent tasks, upcoming activities, and pending decisions.

2. Organization Profile & Verification
Identity, mission, service areas, documents, verification status, and team access.

3. Civic Issues & Help Requests
Discover reports, assess relevance, provide evidence, and offer assistance.

4. Campaigns & Activities
Create, publish, organize, execute, document, and complete campaigns.

5. Volunteers & Field Operations
Recruit volunteers, assign tasks, record attendance, and manage field activity.

6. Evidence & Verification
Upload evidence, respond to review requests, and track verified claims.

7. Government Coordination
Send requests, submit supporting evidence, and track official responses.

8. NGO Network & Resources
Find partners, join joint campaigns, request equipment, and offer resources.

9. Community & Awareness
Answer questions, publish educational resources, and communicate campaign updates.

10. Impact, Rewards & Recognition
Verified contributions, outcome reports, certificates, and recognition history.

11. Notifications & Pending Actions
Review requests, volunteer changes, campaign deadlines, and follow-up reminders.

12. Team, Permissions & Audit History
Invite staff, assign roles, revoke access, and review sensitive actions.

The dashboard should show different actions based on the logged-in member's role. For example, a volunteer coordinator can manage attendance but should not automatically be able to change organization ownership or approve their own evidence.

2. Feature-by-feature list: what the NGO can do

Feature 1 — NGO overview dashboard

What the NGO sees

- Organization verification status.
- Active, draft, pending-review, completed, and cancelled campaigns.
- Pending evidence reviews and requested corrections.
- Upcoming activities and volunteer capacity.
- Civic issues needing attention.
- Government coordination requests awaiting responses.
- Partnership invitations and resource requests.
- Verified outputs and follow-ups due.
- Recent activity and alerts.

What the NGO can do

- Open a pending task directly.
- Resume a draft campaign.
- Review a returned evidence submission.
- Respond to a partner invitation.
- Follow an issue or government request.
- Access campaign reports and organization settings.

What you need to implement

- Dashboard summary API.
- Organization-scoped data queries.
- Campaign and evidence status aggregation.
- Notifications and pending-action counts.
- Role-based visibility.

Do not calculate every statistic separately on the frontend. Use consistent backend queries or summary endpoints so counts do not disagree between pages.

Feature 2 — NGO registration and verification

What the NGO can do

- Create an organization profile.
- Select its mission: sanitation, environment, education, health, accessibility, welfare, disaster relief, or other approved categories.
- Declare its service areas and operational capacity.
- Submit relevant organizational documents.
- Verify its representative and contact information.
- Invite authorized team members.
- View verification progress, submit corrections, and appeal decisions.

What you need to implement

- Organization and membership database models.
- Document upload with private storage.
- Verification application workflow.

- Reviewer interface for platform administrators.
- Organization status and capability checks.
- Permission restrictions for unverified or suspended accounts.
- Audit logs for verification decisions.

Important: a verified account should not automatically receive permission to conduct every kind of activity. A community cleanup and a specialist public-health intervention have different requirements.

Feature 3 — Civic issue discovery and assessment

This is the main connection between the citizen and NGO sides of PrajaPulse.

What the NGO can do

- Browse relevant civic issues on the existing feed and map.
- Filter by location, category, urgency, age, and mission fit.
- Open a report and inspect its permitted details.
- Indicate interest in helping.
- Request additional information through a mediated channel.
- Submit supplementary evidence.
- Flag a potential duplicate or related issue.
- Propose a site assessment.
- Offer an intervention or refer the issue to another capable organization.
- Decline an issue with a reason, such as outside service area or insufficient capacity.

What you need to implement

- Reuse the existing civic issue API and database.
- Add organization mission and geographic coverage fields.
- Create an NGO-to-issue association record.
- Add interest, assessment, evidence, and referral actions.
- Apply authorization rules before returning citizen information.
- Provide a workflow for notifying the citizen where appropriate.
- Preserve the existing government issue status and lifecycle.

Do not create a separate NGO issue database. The NGO should interact with the same canonical civic issue record used by citizens and government, with role-specific permissions.

Feature 4 — Campaign creation and management

This is the central operational feature of the NGO account.

What the NGO can do

- Create a cleanup, awareness, assessment, training, or community-support campaign.
- Link it to one or more existing civic issues.
- Define objectives, location, dates, volunteer capacity, resources, and tasks.
- Set participation requirements and safety instructions.
- Submit the campaign for review where required.
- Publish an approved campaign.
- Open or close volunteer registration.
- Reschedule, pause, modify, or cancel the activity.
- Assign team members and task owners.
- Track progress during execution.

- Submit final results and completion evidence.
- Mark an activity partially completed when appropriate.
- Schedule follow-up monitoring.

What you need to implement

- Campaign database model and state machine.
- Campaign creation and editing forms.
- Risk-based approval workflow.
- Campaign-to-issue linking.
- Task assignment and progress tracking.
- Volunteer registration and capacity limits.
- Notifications for campaign changes.
- Evidence submission and review integration.
- Duplicate campaign detection.
- Cancellation, partial-completion, and dispute handling.

Connection: campaign results should update the NGO dashboard, volunteer histories, evidence review queue, issue activity timeline, and impact reports. They should not automatically mark a government issue as resolved.

Feature 5 — Volunteer recruitment and management

What the NGO can do

- Publish volunteering opportunities.
- Define the task, time, location, eligibility, capacity, and safety requirements.
- View applications and accept or decline volunteers.
- Assign volunteers to specific tasks.
- Send campaign updates and instructions.
- Record attendance and task completion separately.
- Handle late cancellations and waitlists.
- Record volunteer incidents and disputes.
- Recognize supported contributions.

What you need to implement

- Volunteer opportunity and registration models.
- Application statuses: pending, accepted, declined, withdrawn, and waitlisted.
- Task assignment model.
- Attendance records with correction history.
- Volunteer notifications.
- Participant consent and privacy controls.
- Duplicate registration protection.
- Incident-reporting workflow.
- Volunteer participation history.

Connection: the citizen account should display its own applications, schedules, assignments, and participation records. The NGO should see only the information needed to coordinate the activity.

Feature 6 — Field operations and task tracking

What the NGO can do

- Schedule site visits.
- Assign field coordinators.
- Record a site assessment.
- Create work tasks and mark progress.
- Record materials or equipment used.
- Upload before-and-after evidence.
- Record waste collected, sites inspected, or other mission-specific outputs.
- Report incomplete work, hazards, and unexpected conditions.
- Escalate work requiring specialist or government intervention.

What you need to implement

- Field task and task status models.
- Site and location references.
- Evidence upload integration.
- Measurement fields with units.
- Field notes and incident records.
- Offline-friendly draft submission if field connectivity is unreliable.
- Task completion authorization.
- Optional check-in mechanism that does not require continuous tracking.

Connection: field tasks should belong to a campaign, and the campaign may link to a civic issue. This allows PrajaPulse to trace the chain from issue → planned activity → field task → evidence → verified contribution.

Feature 7 — Evidence submission and verification

What the NGO can do

- Submit photographs, documents, measurements, and written observations.
- Attach evidence to a campaign, task, or civic issue.
- Respond when a reviewer requests corrections.
- View whether a claim is submitted, supported, partially supported, disputed, or unverified.
- Request a review or appeal an adverse decision.
- Correct an earlier claim while preserving its history.

What you need to implement

- Private media storage.
- Evidence metadata and versioning.
- Evidence-to-campaign/task/issue relationships.
- Reviewer queue and review decisions.
- Duplicate-image and metadata checks where appropriate.
- Privacy screening and redaction.
- Reviewer conflict-of-interest checks.
- Audit logs and appeal workflow.

Connection: evidence review should drive verified output records and eligibility for recognition. Uploading a photo must not automatically award rewards or verify a campaign.

Feature 8 — Government coordination

What the NGO can do

- Request assistance from the relevant government department.
- Submit supplementary evidence for an issue.
- Request an inspection or official response.
- Track the coordination request's status.
- Add follow-up observations.
- Report that its own work is blocked by an unresolved government dependency.
- Share campaign outcomes with authorized officials.

What you need to implement

- Department and government-user references.
- Coordination request model.
- Request submission and response workflow.
- Official response records with timestamps and sources.
- Notifications and follow-up reminders.
- Permission checks for official records.
- Manual coordination fallback when no government API exists.
- Clear separation between NGO activity status and government issue status.

Connection: an NGO request should appear in the authorized government workflow or a tracked manual queue. Only an authorized government actor or trusted official integration should update the official government status.

Feature 9 — NGO-to-NGO network and collaboration

What the NGO can do

- Discover relevant organizations by mission, location, and verified capabilities.
- Send collaboration invitations.
- Join or propose a joint campaign.
- Request volunteers, equipment, materials, expertise, or logistical help.
- Offer available resources.
- Define the lead organization and partner responsibilities.
- Share approved evidence.
- Track each partner's contribution.
- Withdraw from a partnership under the agreed process.
- Resolve attribution disputes.

What you need to implement

- Organization discovery and search.
- Partnership invitation and acceptance workflow.
- Campaign partner records.
- Resource request and offer records.
- Task ownership and responsibility assignment.
- Shared evidence permissions.
- Contribution attribution.
- Partnership cancellation and dispute workflow.

Connection: the same campaign can have multiple partner organizations, but the shared outcome should be recorded once. Each organization's contribution should be recorded separately.

Feature 10 — Community interaction and public awareness

What the NGO can do

- Respond to relevant citizen questions.
- Publish campaign announcements and progress updates.
- Invite citizens to public activities.
- Publish educational material.
- Organize awareness sessions and training.
- Share approved resource directories and practical guidance.
- Receive suggestions and feedback.
- Collect voluntary feedback after activities.
- Report safeguarding concerns or inappropriate behavior.

What you need to implement

- Campaign discussion or moderated communication.
- Public content and educational resource models.
- Content moderation and reporting.
- Citizen consent and communication preferences.
- Image publication permissions.
- Spam and abuse controls.
- Feedback records.
- Clear public labeling of the NGO's verification status and role.

Connection: reuse the platform's existing feed and notification system if available. Avoid building a second social network exclusively for NGOs.

Feature 11 — Resource requests and offers

What the NGO can do

- Request cleanup equipment, supplies, transport, venue space, volunteers, or specialist help.
- Specify quantity, location, deadline, and intended use.
- Offer available resources to another organization.
- Accept or decline a resource offer.
- Record delivery and usage.
- Report shortages or unfulfilled commitments.

What you need to implement

- Resource request and offer models.
- Resource categories and quantity units.
- Request statuses and fulfilment records.
- Organization and campaign associations.
- Permissions for private contact details.
- Dispute handling for unfulfilled offers.

Connection: resources should be linked to the relevant campaign or organization. Do not introduce a financial marketplace or payment feature unless you separately design the required financial controls.

Feature 12 — Impact reports and accountability

What the NGO can do

- View campaign history and completion rates.
- Generate reports for a selected period.
- Record planned versus delivered outputs.
- Report partially completed or unsuccessful activities.
- Track volunteer participation.
- Track supported civic issues.
- Record resource use and costs where relevant.
- Monitor recurring problems.
- Schedule follow-up checks.
- Export evidence-linked reports.

What you need to implement

- Contribution and impact measurement models.
- Standard metric definitions and units.
- Report generation and export.
- Verification status on each metric.
- Follow-up scheduling.
- Shared-outcome attribution.
- Data validation and duplicate counting prevention.

Connection: reports should draw from campaign, task, volunteer, evidence, issue, and coordination records. Do not ask the NGO to manually re-enter data that is already recorded elsewhere.

Feature 13 — Rewards and recognition

What the NGO can receive

- Verified contribution records.
- Campaign completion certificates.
- Public impact profile.
- Recognition for meaningful collaboration.
- Featured case studies after editorial review.
- Eligibility to apply for relevant resource opportunities.
- Potential future grants only through a separate, legitimate funding mechanism.

What the NGO should not automatically receive

- Money for creating campaigns.
- Points for every photograph or volunteer registration.
- Guaranteed funding based on a score.
- Official priority or government authority.
- Recognition for unsupported or duplicated outcomes.

What you need to implement

- Contribution ledger.
- Recognition eligibility rules.
- Evidence-review dependency.
- Idempotency and duplicate prevention.
- Recognition history and reversal records.
- Appeals and dispute handling.

- Separate financial controls if funding is ever introduced.

Connection: the NGO recognition model should integrate with the existing PrajaPulse rewards module through a distinct organization-level contribution workflow. Do not blindly reuse individual citizen point rules.

Feature 14 — Organization team and permissions

What the NGO can do

- Invite team members.
- Assign or remove roles.
- Assign campaign responsibilities.
- Manage organizational contact information.
- Review team activity.
- Transfer ownership through a protected process.
- Remove former members.

Recommended roles

Role	Main permissions
Owner / primary representative	Organization settings, ownership, team administration, privileged approvals
NGO administrator	General organization operations and member management within delegated limits
Campaign manager	Create, edit, publish when authorized, and manage campaigns
Field coordinator	Manage assigned field tasks, attendance, and field reports
Volunteer coordinator	Manage volunteer applications, assignments, and communication
Evidence submitter	Upload evidence and respond to review requests
Finance/compliance officer	Access permitted financial and compliance records
Read-only member	View authorized organization and campaign information

What you need to implement

- Organization membership model.
- Role-based authorization.
- Campaign-specific assignment permissions.
- Server-side access checks.
- Invitation and account recovery workflow.
- Audit history.
- Immediate permission revocation when a member is removed.

Feature 15 — Notifications and pending actions

What the NGO receives

- Verification decisions and requests for additional documents.
- Campaign approval, rejection, and modification notices.
- Volunteer applications, withdrawals, and cancellations.
- Upcoming event reminders.
- Evidence review requests and decisions.

- Government responses.
- Partnership invitations.
- Resource request updates.
- Follow-up monitoring reminders.
- Security and account alerts.

What you need to implement

- Notification event definitions.
- In-app notification storage.
- Read/unread state.
- User notification preferences.
- Push delivery if Firebase is already configured.
- Deep links to the relevant campaign, task, or request.
- Retry handling and notification logs.

Connection: notifications should be triggered by backend state changes, not just frontend button clicks.

Feature 16 — AI assistance for NGOs

Your PrajaPulse diagrams already include AI image scanning, chatbot support, and predictive impact. The NGO login can use these capabilities, but each needs a defined job.

AI capability	What it does for NGOs	What you need to implement
Issue matching	Recommends relevant civic issues based on mission and service area	Issue categories, NGO capability tags, geographic filters, matching logic
Duplicate detection	Flags campaigns or evidence that may duplicate existing records	Text similarity, image similarity, location/time comparison
Campaign assistant	Helps draft objectives, tasks, checklists, and public descriptions	Prompt templates, structured outputs, validation
Evidence assistance	Flags possible image reuse, inconsistencies, or missing documentation	Image processing, metadata checks, review queue
Impact report assistant	Drafts reports from recorded campaign data	Access-controlled data retrieval, report templates, factual validation
Chatbot support	Explains workflows and helps users navigate the platform	Knowledge base, role-aware retrieval, safe tool permissions
Follow-up recommendations	Suggests which completed activities may need another site check	Follow-up rules, historical issue records, scheduling

Implementation rule: AI suggestions must be distinguishable from verified records. The AI may recommend that an NGO inspect a location; it must not independently declare the location clean or a government issue resolved.

Feature 17 — NGO profile and public impact page

What the NGO can manage

- Organization description and mission.
- Service areas and areas of expertise.
- Verified organizational status and approved capabilities.

- Public contact method.
- Active and completed campaigns.
- Evidence-backed impact summaries.
- Partner organizations.
- Published educational resources.
- Recognition and certificates.

What you need to implement

- Public organization profile.
- Privacy controls for each profile field.
- Public campaign listing.
- Verified status labels and capability scope.
- Moderated content publication.
- Report or flag organization functionality.
- Links from the public profile to the relevant campaigns and supported contribution records.

Do not expose registration documents, internal team details, private evidence, or beneficiary information on the public profile.

Feature 18 — Compliance, complaints, and audit history

What the NGO can do

- View document expiry and renewal reminders.
- Respond to compliance requests.
- Report a safety incident.
- Respond to a complaint about its activity.
- Appeal a restriction or evidence decision.
- Review its own permitted audit history.
- Correct inaccurate public claims.

What you need to implement

- Compliance document status and expiry tracking.
- Complaint and incident records.
- Restricted reviewer workflows.
- Appeals and reasoned decisions.
- Audit logging.
- Role-based access to sensitive cases.
- Organization restriction and reinstatement states.

This module is particularly important once organizations are allowed to recruit volunteers, coordinate activities, or submit public impact claims.

3. What must connect to what?

The key implementation work is integrating the NGO module with the existing citizen, government, AI, and rewards systems.

Citizen App
Civic Issue Module
NGO Workspace
Campaign Management
Volunteer Management
Field Tasks
Evidence and Review
Contribution and Impact Records
Rewards and Recognition
Impact Reports
Government Coordination
NGO Collaboration
AI Assistance
Notifications

Integration checklist

Existing PrajaPulse module	NGO connection required	Main implementation task
Authentication/login	Organization account and team memberships	Role and organization-scoped authorization
Citizen issue reporting	NGO discovers and supports existing reports	Reuse issue records and add NGO associations
Feed and map	Relevant issues and public campaigns appear in appropriate views	Shared feed queries, filters, and visibility rules
Community voting/validation	NGO can view permitted community signals	Read-only integration unless a separate authorized action is defined
AI issue classification	NGO sees issue categories and relevant recommendations	Reuse classification outputs; do not create duplicate classifications
AI image scanning	Flag potentially reused or inconsistent campaign evidence	Extend image checks and route flags to human review
Government escalation	NGO submits supplementary evidence and coordination requests	Coordination request workflow and authorized status updates
NGO and help-center network	Connect NGOs, campaigns, and assistance requests	Organization directory and collaboration relationships
Volunteer/citizen accounts	Citizens apply and track their own participation	Shared user identity and volunteer registration records
Rewards and points	Recognize verified NGO contributions	Separate contribution ledger and organization-level recognition rules
Accountability dashboard	Show supported contributions and outcomes	Shared metric definitions and evidence-linked records
Notifications	Inform the correct roles about workflow changes	Event-driven notification service
File/image storage	Store private evidence and approved public media	Access-controlled storage, metadata, and redaction
AI chatbot	Answer role-appropriate questions and guide actions	Permission-aware retrieval and controlled tool access
Predictive impact	Support planning and follow-up recommendations	Historical data, metric definitions, and evaluation
Admin/moderation	Review NGO applications, campaigns, evidence, and disputes	Dedicated review queues and audit history

4. Database and backend components you will need

These are the main data structures to check against your existing schema. Reuse existing tables when the same information is already represented.

Organization and access

Establishes who the NGO is and what it can do.

- `organizations`
- `organization_memberships`
- `organization_verification_applications`

- `organization_capabilities`

Campaign operations

Connects campaigns to issues, people, tasks, and partners.

- `campaigns`
- `campaign_tasks`
- `campaign_issue_links`
- `campaign_partners`
- `volunteer_registrations`
- `attendance_records`

Evidence and accountability

Records what happened and which claims are supported.

- `evidence_records`
- `verification_reviews`
- `impact_measurements`
- `contribution_records`
- `recognition_records`
- `follow_up_checks`

Collaboration and communication

Supports cross-organization and government workflows.

- `resource_requests`
- `partnership_requests`
- `government_coordination_requests`
- `notifications`
- `complaints_and_disputes`
- `audit_events`

The final schema should depend on the actual repository. These names are proposed structures, not a claim that those tables already exist.

5. NGO login roles and permissions

The account type determines which workspace a user enters. The membership role determines what they can do inside that workspace.

Login/account type	What they should access
Citizen	Issue reporting, volunteering, campaign participation, personal contribution history
NGO member	The organization's permitted workspace and assigned activities
Government official	Authorized issue handling, official responses, government workflow
Platform administrator/reviewer	Verification, moderation, disputes, and other explicitly authorized platform functions

An NGO must not gain access to government controls simply because it is verified. Likewise, an NGO member should not automatically gain access to all of the organization's sensitive records.

For the MVP, use the existing authenticated user system and associate users with organizations through memberships. Avoid creating a completely separate authentication system for NGOs unless your current architecture makes it necessary.

6. What to implement first

NGO implementation checklist

0 of 12

Foundation

- ☐ Inspect existing authentication, roles, issue schema, and rewards
- ☐ Create organization profile, membership, and verification workflows

Issues

- ☐ Connect NGO issue discovery to the existing civic issue feed

Campaigns

- ☐ Implement campaign creation, review, publication, and state transitions
- ☐ Link campaigns to existing civic issues

Volunteers

- ☐ Implement applications, assignments, attendance, and task completion

Evidence

- ☐ Implement private uploads, evidence records, and review decisions

Integration

- ☐ Connect NGO activities to government coordination requests
- ☐ Implement notifications for campaign and review state changes

Impact

- ☐ Implement contribution records, impact reports, and recognition

Collaboration

- ☐ Add partner invitations and shared campaign attribution

Advanced

- ☐ Add AI assistance, resource marketplace features, and advanced analytics

Copy checklist

Final recommendation

For your first working version, prioritize organization verification → issue discovery → campaign management → volunteer coordination → evidence verification → impact reporting.

These six connected workflows give the NGO account a practical purpose. The other features should extend that foundation rather than become isolated dashboard pages.

The most important technical decision is to use the same canonical issue, citizen, notification, and government records that PrajaPulse already uses. Add NGO-specific relationships and permissions around them. That prevents duplicated data, inconsistent statuses, and reward claims that cannot be traced back to real work.
